

[FAQ]

What is the encryption key size of Webcam SSL?

Release Date: 3/5/2015

Applied to

GV-Multicam v8.59

Question

What is the encryption key size of Webcam SSL?

Answer

Webcam's SSL uses RSA private key size 1024 bit by default when enabled. The key size can be changed depending on what customer requires.

The encryption part between server and client is not handled by Webcam, it is done when server and client does handshaking and it can be either AES128, AES256 or other standards etc. depending on the server to client encryption.
